

Solving apt-get update “Temporary failure resolving ‘us.archive.ubuntu.com’” error

First, temporarily add a known DNS server to your system.

```
echo "nameserver 8.8.8.8" | sudo tee /etc/resolv.conf > /dev/null
```

Then run `sudo apt-get update`.

If this fixes your temporary resolving messages then either wait for 24 hours to see if your ISP fixes the issue for you (or just contact your ISP) - or you can permanently add a DNS server to your system:

```
echo "nameserver 8.8.8.8" | sudo tee  
/etc/resolvconf/resolv.conf.d/base > /dev/null
```

8.8.8.8 is Google's own DNS server.

Another example DNS server you could use is OpenDNS - for example:

```
echo "nameserver 208.67.222.222" | sudo tee  
/etc/resolvconf/resolv.conf.d/base > /dev/null
```
